

SMRITI+ Demo Script

Smart India Hackathon 2026 | Problem Statement 26003
Target runtime: 5 minutes (expandable to 8) | 3 presenters

Roles

Presenter 1	Opens and closes. Problem framing, impact, and why it matters. Does not handle the device.
Presenter 2	Drives the phone. Speaks only to narrate what is being tapped. Mirror the screen if the venue allows.
Presenter 3	Technical story - scoring model, adaptive logic, architecture. Takes questions from the panel.

Timing at five minutes

Segment	Who	Time
Problem and solution framing	Presenter 1	45 sec
Live demo - two memory rounds	Presenter 2	90 sec
Caregiver dashboard and technical model	Presenter 3	60 sec
Voice assistant	Presenter 2	30 sec
Impact, scale and close	Presenter 1	45 sec

Plan for five minutes with material that stretches to eight. Panels run late and cut presenters off, so never build a script that only works at the upper bound.

The script

Change the wording to sound like you. A script you cannot say naturally is worse than notes.

1. Opening — Presenter 1 (45 sec)

"Good morning. In India, more than 100 million people are above 60. Many of them slowly start losing memory. But nobody notices it early, because it happens between doctor visits — and doctor visits are once in six months.

Families see something is wrong. They cannot measure it. They cannot tell the doctor how much it has changed.

There are many reminder apps. They tell you to take medicine. They do not measure your memory. SMRITI+ does both. It gives the elderly person a daily brain exercise, measures how they perform, adjusts itself to their level, and shows the family what is happening."

2. Live demo — Presenter 2 (90 sec)

Open the app. Home screen.

"This is what the user sees. Their name, their progress, today's exercise."

Tap START. Play the round and get most of it wrong.

"The colours appear, then disappear. The user repeats the order. I am doing this badly on purpose."

Result screen.

"Score 42. The app measured three things — how accurate, how fast, how consistent. And look here: it has reduced the difficulty for next time. The user did not change any setting. The app decided."

Tap NEXT ROUND. Play it well.

"Now I will do it properly."

Result screen.

"Score 88. Difficulty has increased. The exercise is now harder. This is the core of SMRITI+ — it meets the user where they are."

3. Technical — Presenter 3 (60 sec)

Open the caregiver dashboard.

"This is the caregiver's view — for the son, daughter, or nurse.

The score is not random. Accuracy is 50 percent of it, speed is 30 percent, consistency is 20 percent. Difficulty moves between 3 and 8 blocks depending on performance.

Here the app compares recent sessions and tells the family the direction — improving, stable, or needs attention. That is the sentence a family can actually take to a doctor.

Everything is stored on the phone. No cloud, no server. Health data never leaves the device."

4. Voice — Presenter 2 (30 sec)

Open the voice assistant. Tap the microphone. Say: "Start my memory exercise." The app replies and opens the game.

"Many elderly users cannot read small text or navigate menus. They can speak. That is why voice is not an extra feature here — for some users it is the only way in."

5. Closing — Presenter 1 (45 sec)

"SMRITI+ needs one ordinary Android phone. No hardware, no internet, no subscription.

It can go through Anganwadi workers, ASHA workers, old age homes, or a family can just install it.

Right now, cognitive decline in India is noticed when it is already bad. We are trying to make it visible early — while something can still be done.

Thank you."

If you get the extra three minutes

- Reminders with scheduled local notifications.
- Multilingual roadmap, starting with Hindi voice recognition.
- Data privacy - everything is on-device and nothing leaves the phone, which is a strong answer for health data.
- Deployment model through ASHA and Anganwadi networks.

Preparation checklist

- **Seed the demo phone the night before.** Play about ten rounds with a deliberate dip and recovery, so the dashboard trend reads Improving and the chart has visible shape. An empty dashboard shows "Not enough data" and wastes the strongest screen.
- **Rehearse the bad round at least five times.** Scoring badly on purpose is harder than it sounds under pressure. If you accidentally score 85 on the round meant to show difficulty dropping, the centrepiece inverts.
- **Phone settings:** Do Not Disturb on, brightness at full, screen timeout set to 10 minutes.
- **Carry screenshots as a fallback.** Phones die.
- **Decide on notifications.** Do not demo them live until they have been seen firing on a locked phone. If unverified, describe them instead - Presenter 3 can mention scheduled local notifications while showing the reminder list.

Delivery notes

- Say the numbers slowly. 42 and 88 are the two numbers judges will remember.
- When the score is bad, do not apologise or laugh. Say it flatly - you meant to do that.
- If the phone freezes, Presenter 1 keeps talking while Presenter 2 fixes it. Silence is what looks bad, not a slow phone.
